

Title: "Methods in High dimensional data analysis"

Abstract

The availability of big and high dimensional data poses new challenges to the arena of statistics. It is well established that methods of classical statistics are no more adequate to deal with these kinds of data. For couple of decades statisticians all over the world tried to come up with pertinent and applicable statistical methods for analysis of such data. In this presentation I will discuss some of the salient tools to analyse high dimensional data effectively.
